

OCENS XWeb

For Globalstar

**Enjoy Free Access to Fast Wireless Web Browsing and Web Email
with your Globalstar Voyager or Liberty Service Plans**

Features and Benefits

- **Web Content Compression**

Up to 10x improvement in speed. Uses Windows internal compression option so you don't need to install any additional programs.

- **Accelerates Web Email Transfers**

XWeb's compression technology applies to your webmail transactions as well. OCENS Mail wireless email service provides even faster email transfers (3 to 4x faster than XWeb alone).

- **Removal of Graphics Backgrounds**

Background images are stripped since they do not provide content and take time to download.

- **Pop-Up Advertising Blocked**

Pop-up advertisements are blocked thereby further accelerating the delivery to you of the content in which you are really interested.

- **Ads Removed from Web Content**

Further bandwidth savings are provided by removing images containing advertisements from the HTML pages as the pages download.

- **Images are Resampled and Compressed**

GIF and JPEG's are reduced in resolution 'on-the-fly' as pages load. The subsequent up to 90% reduction in picture resolution dramatically speeds up page loads and reduces the amount of time you must spend online.

- **Auto-Redial and Reconnect**

Should your signal drop, XWeb will automatically attempt re-dial and reconnection.

- **Fast Access to Full Resolution Content**

Click on the 'View Unmodified Page' reference on any page to quickly see full resolution content.

- **Compatible with Your Operating System**

OCENS XWeb will run on Windows (Win 2000 and XP), Macintosh or Linux computers connected to your Globalstar phone.

How does it work...

For many people, web browsing and using email has become a routine part of our daily lives. We browse at home, at the office and while we vacation. We browse for information critical to our business and our daily lives; to manage our personal finances or to check the latest sports results. In addition, we send and receive email on a seemingly continuous basis. In fact, web browsing and emailing has become such an important part of our lives and businesses that our need to continue to do so even when we are in remote locations is one of the primary reasons people purchase data-capable Globalstar phones.

Unfortunately, web browsing is an inherently high bandwidth activity. That is, it typically works best when it can run over high speed modem, DSL and cable connections. The web is so full of advertisements, pictures, imbedded graphics and other content that lower bandwidth, slower connections typically struggle to keep up. And email isn't much different. Although Globalstar is one of the few satellite systems that offer data speeds that even allow you to consider email transfers and web browsing, data transfers remain far slower than what we are accustomed to at our homes and offices.

OCENS XWeb changes all that when you use its compressed data capabilities with your Globalstar phone. XWeb is designed to enhance webmail transfers and web browsing over your Globalstar phone by compressing graphics, limiting advertisements and eliminating background images which can be heavy consumers of satcomm bandwidth. XWeb also compresses text streams, removes annoying pop-up advertisements, and does away with backgrounds and animations—all of which slow down your web transfer rates. Further improvements in speed occur with XWeb's built-in capacity to reduce picture sizes to 5% of their original size. As a result, you use the web at a rate which is in most cases 5 times faster than otherwise possible on your Globalstar phone. Some users enjoy up to a 10x improvement in their load time.

Save time, save money and get more done with OCENS XWeb over your Globalstar phone!
